IPv4 exhaustion at AFRINIC

Exhaustion drives up address costs & NATs

How will you deal with IPv4 exhaustion?

Deploy IPv6

Deploy NAT on Steroids

Wait and see

Our recommendations

1. Secure IPv4 resources from AFRINIC
2. Get IPv6 resources
3. Learn as you deploy ([afrinic.academy](#) has everything you need to start)
4. Set a small goal to actually advance IPv6
5. If you ever get stuck, call for help from us at [bit.ly/6deployEN](#)

What is IPv6?

RFC8200

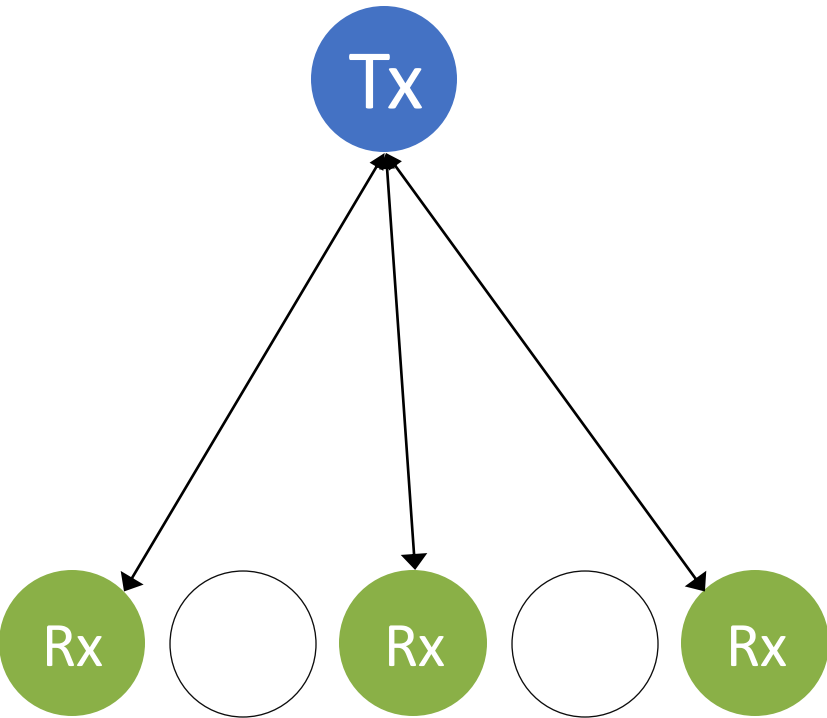

- A new version of the Internet Protocol (IP) designed as a successor to IP version 4. The changes fall primarily into the following categories:
 - Expanded Addressing Capabilities
 - Header Format Simplification
 - Improved Support for Extensions and Options
 - Flow Labelling Capability
 - Authentication and Privacy Capabilities

There're 3 types of IPv6 addresses

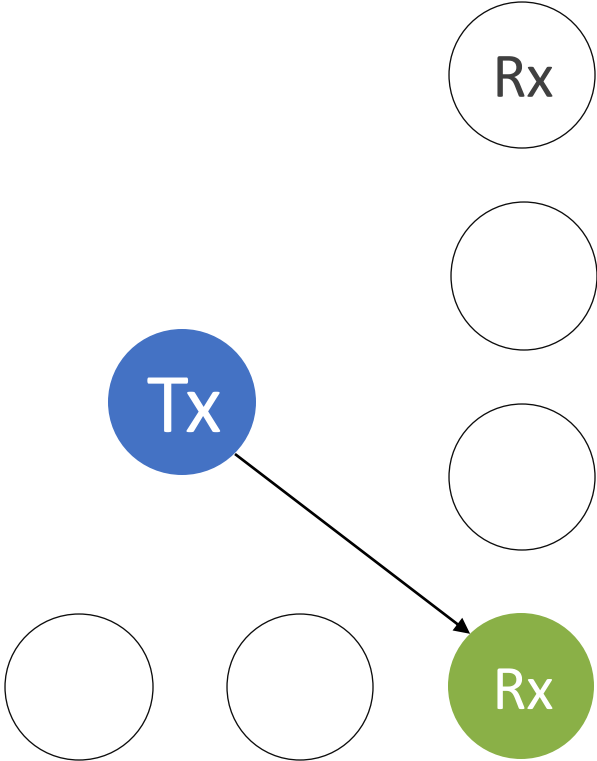

1:1
Unicast

1:n
Multicast

1:closest
Anycast

No broadcast addresses (or communications) in IPv6

More than ever, you need DNS !

- The DNS has always been around to 'map' one element to another like a phonebook
- E.g : `www.afrinic.net` maps to
 - `196.216.2.6` (*A record*)
 - `2001:42d0:0:200::6` (*AAAA record*)
- All you have to remember is ... the name

There're 3 categories of transition techniques

Dual stack

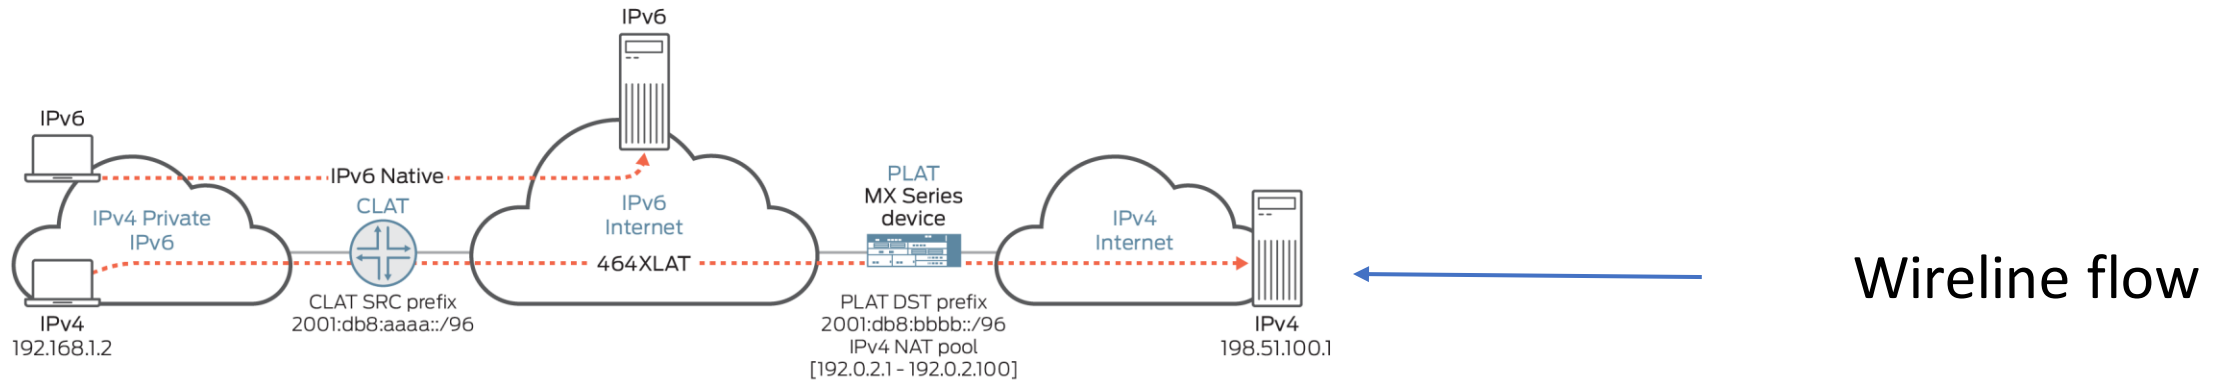

Tunneling

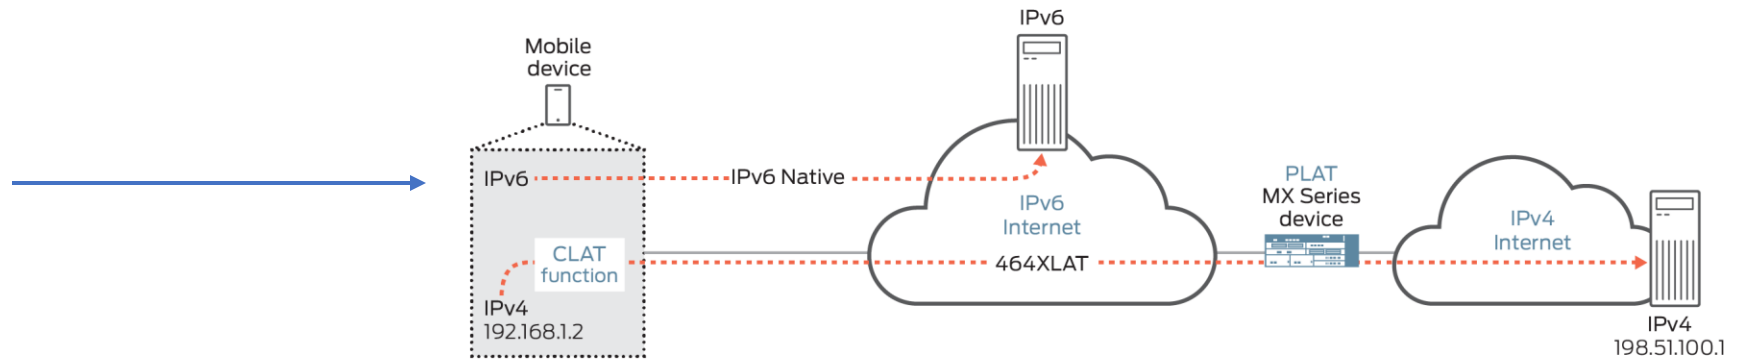

Translation

One transition technique: 464XLAT

8043569

Wireless flow

8043572

IPv6 at AFRINIC

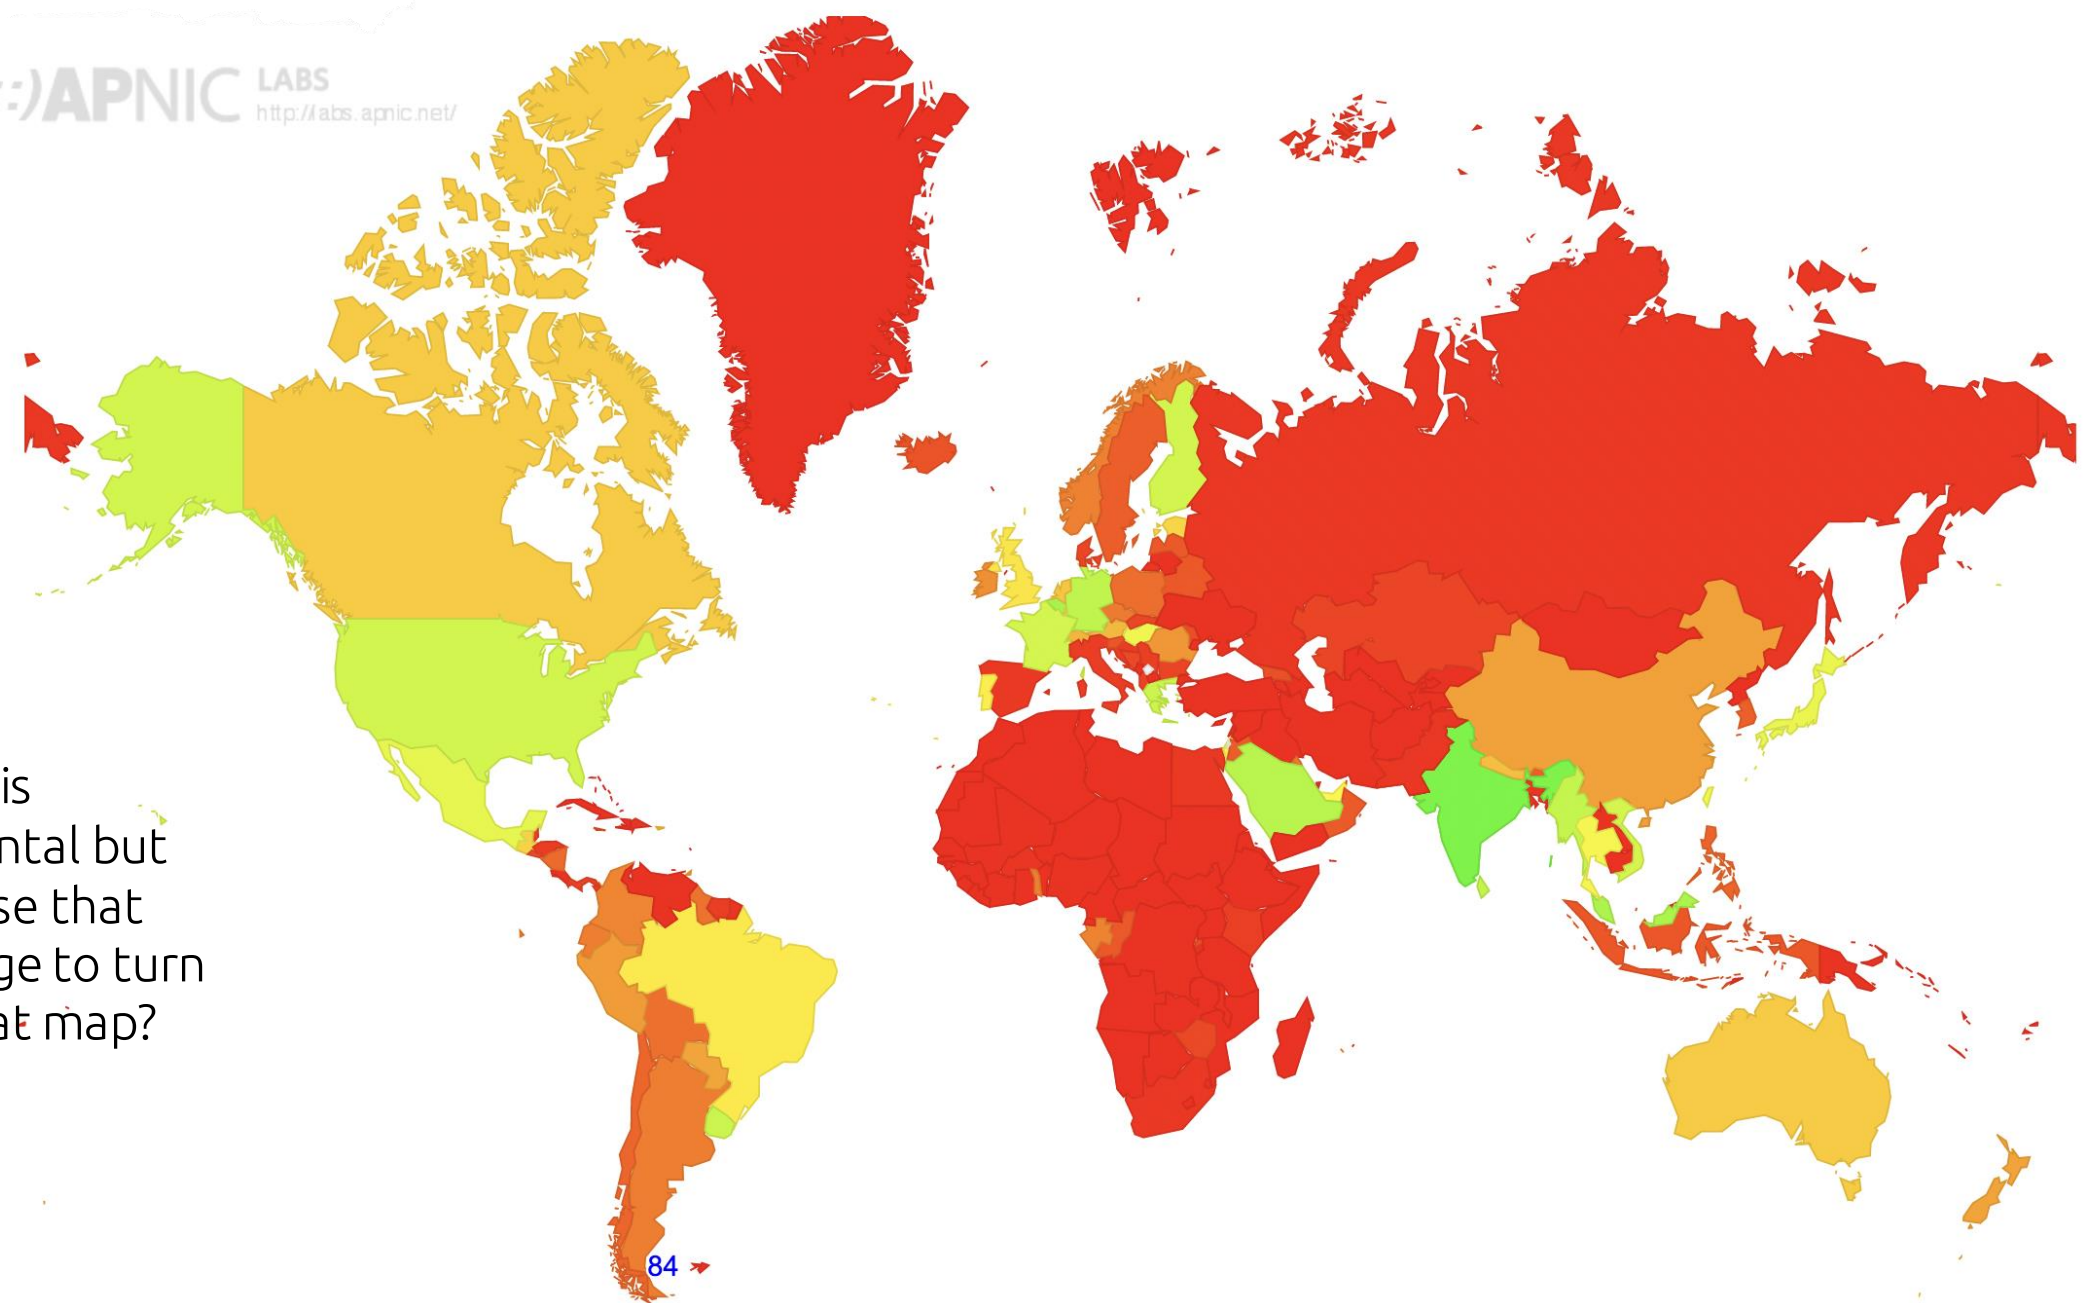

The learning path at AFRINIC

- At AFRINIC, we have an elearning platform that help people understand and master IPv6 concepts → <https://afrinic.academy/>
- You can even get certified with our internationally recognised certification platform → <https://certi6.io/>

IPv6 Capable Rate by country (%)

(::)APNIC LABS
<http://abs.apnic.net/>

Learning is fundamental but can we use that knowledge to turn green that map?

Our Solutions

DO Helpdesk

(e-)Deployathon

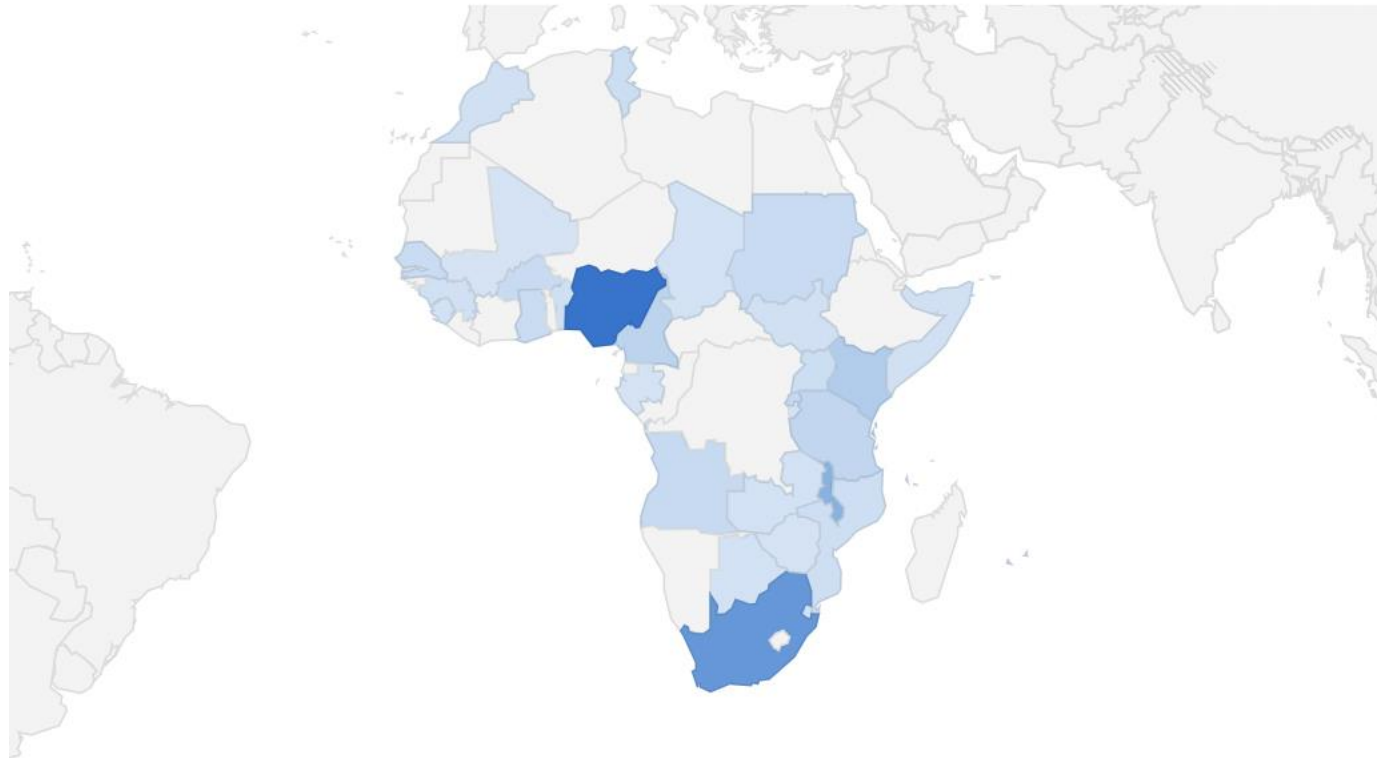

Deliver expert guidance to operational engineers so they can collaborate with their peers from different networks to confidently implement IPv6 on their network

How we measure success: Milestones

- IPv6 prefix (PI)
- Correct RPKI ROA
- Valid route6 object
- Advertised IPv6 prefix
- Validated address plan (IPAM)
- Completed network audits
- IPv6 traffic from test VLAN
- IPv6-enabled DNS
- IPv6-enabled email
- IPv6-enabled website
- IPv6 domain objects
- DNSSEC signed IPv6 reverse zone
- IPv6-enabled access network
- IPv6-enabled customer
- Detailed IPv6 project plan

What is the impact of our actions so far?

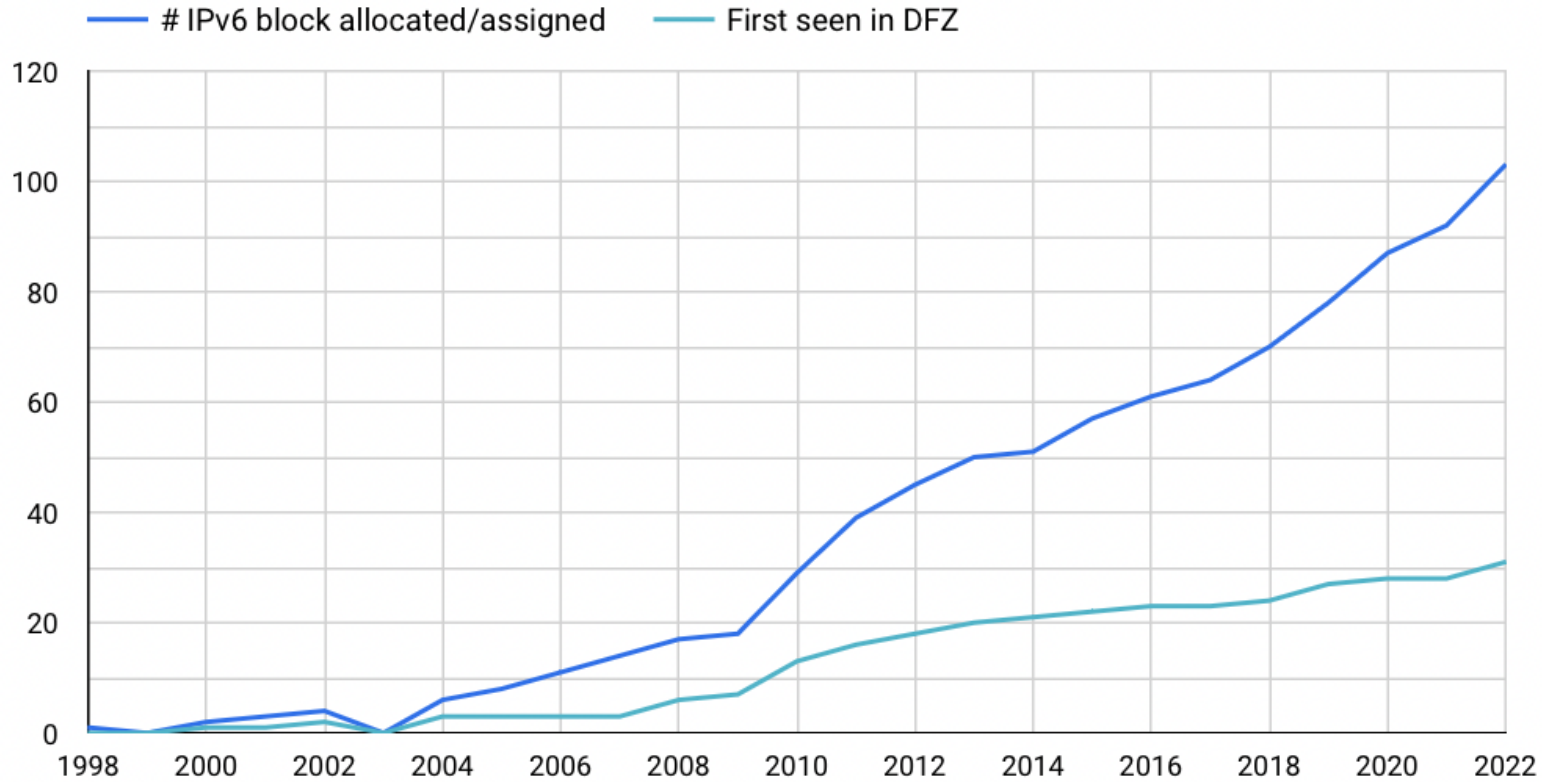

As at 24 October 2022:

- 367 deployment milestones attained
 - 102 from Nigeria
- 146 organisations
- 32 countries

1 102

IPv6 resources usage from AFRINIC members in Nigeria

- 103 AFRINIC members with IPv6 blocks allocated/assigned
- 31 AFRINIC members with IPv6 blocks advertised (*aggregate*)
